Hectoliter Analyse

Test weight is a critical contractual parameter, listed in virtually all domestic and export sales contracts. It measures the density of grain and is calculated as kilograms per hectolitre (kg/hl). It is also used by the storage and transport sectors to determine how much grain will be able to be stored and transported in a given volume of space. As grain growers know, test weight is one of five key physical measurements that regularly occur when grain is being graded at receipt: the others are protein, moisture, screenings and falling number tests. The key characteristic that is indicated by low test weight is compromised dough and end product performance/quality. Low Test Weight indicates that the grain did not form properly or has not maintained its intended form. On the world market, feed wheat generally trades at 72 to 74 kg/hl, while milling grades have a minimum test weight of 76 kg/hl.

Hectomaks

- Hectomaks is made of high quality yellow brass
- Measures hectoliters of different grains like wheat, corn, sunflower, etc.
- Capacity of the hectoliter is 1000 ml.
- It measures hectoliters of wheat, corn, rye, oat, paddy, rice, lentils, etc.
- Capacity of it's scale is 5 kg. Accuracy of the scale is 1 gr.
- The knife fixed to the body is made of stainless steel, the rest is made of yellow brass complied with TSE standards.
- The hectoliter is delivered within a special suitcase.
- Easy set up and measurement at laboratories and fields.

Standard Accessories

Measurement cylinder, refill cylinder, floatball inside the measurement cylinder, fixer rod, knife fixed on the body, precision scale, sampler dish, sampler shovel and suitcase.
